

**Lab Assignment**  
**(Machine Learning-MCA27502)**

**Table of Contents**

---

| <b>Assignment No.</b> | <b>Name of the Experiment</b>   | <b>Page No.</b> |
|-----------------------|---|-----------------|
| 1                     | Implementation of Linear Regression using Python                          |                 |
| 2                     | Implementation of Logistic Regression for Binary Classification           |                 |
| 3                     | Implementation of K-Means Clustering on Unlabeled Data                    |                 |
| 4                     | Implementation of Gradient Descent Optimization Algorithm                 |                 |
| 5                     | Comparison of Different Loss Functions in Machine Learning Models         |                 |
| 6                     | Development of an End-to-End Classification-Based Application             |                 |
| 7                     | Implementation of Support Vector Machine (SVM) for Classification         |                 |
| 8                     | Implementation of K-Nearest Neighbors (KNN) Classifier                    |                 |
| 9                     | Implementation of Decision Tree Classifier                                |                 |
| 10                    | Implementation of Random Forest Classifier                                |                 |
| 11                    | Implementation of Gradient Boosting Classifier                            |                 |
| 12                    | Model Evaluation using Accuracy, Precision, Recall, and F1-Score          |                 |
| 13                    | Performance Evaluation using ROC Curve and AUC                            |                 |
| 14                    | Model Selection using Cross-Validation and Grid Search Techniques         |                 |
| 15                    | Implementation of K-Means Clustering Algorithm                            |                 |
| 16                    | Determining Optimal Number of Clusters using Elbow and Silhouette Methods |                 |
| 17                    | Hierarchical Clustering and Dendrogram Visualization                      |                 |
| 18                    | Density-Based Clustering using DBSCAN                                     |                 |
| 19                    | Gaussian Mixture Model (GMM) for Probabilistic Clustering                 |                 |
| 20                    | Comparative Study of Clustering Algorithms                                |                 |
| 21                    | Dimensionality Reduction using Principal Component Analysis (PCA)         |                 |
| 22                    | Data Visualization using t-SNE  |                 |
| 23                    | Dimensionality Reduction using Autoencoders                               |                 |
| 24                    | Feature Compression and Reconstruction using PCA                          |                 |
| 25                    | Visualization of High-Dimensional Data after Reduction                    |                 |
| 26                    | Development of Unsupervised Learning Model on a Dataset                   |                 |
| 27                    | Implementation of Perceptron for Binary Classification                    |                 |
| 28                    | Implementation of Multi-Layer Neural Network using Backpropagation        |                 |
| 29                    | Study and Comparison of Activation Functions                              |                 |

Program Name and Semester: MCA 2<sup>nd</sup> Semester  
Course Name (Course Code): Machine Learning (MCA57202 (P))  
Class: MCA  
Academic Session: 2025-2026 (EVEN)

|    |   |  |
|----|---|--|
| 30 | Implementation of Convolutional Neural Network (CNN) for Image Classification |  |
| 31 | Visualization of Feature Maps in CNN  |  |
| 32 | Implementation of Recurrent Neural Network (RNN)                              |  |
| 33 | Implementation of Long Short-Term Memory (LSTM) Network                       |  |
| 34 | Optimization Techniques: SGD, Adam, and RMSprop                               |  |
| 35 | Regularization Techniques: Dropout and Batch Normalization                    |  |
| 36 | Overfitting Analysis and Early Stopping Techniques                            |  |
| 37 | Transfer Learning using Pre-trained CNN Models                                |  |
| 38 | Development of CNN-Based Application on a Dataset                             |  |
| 39 | Case Study on Linear Regression-Based Prediction System                       |  |
| 40 | Case Study on Logistic Regression for Classification                          |  |
| 41 | Case Study on Support Vector Machine Application                              |  |
| 42 | Case Study on KNN-Based Classification System                                 |  |
| 43 | Case Study on Decision Tree Model   |  |
| 44 | Case Study on Random Forest Model   |  |
| 45 | Case Study on Gradient Boosting Model   |  |
| 46 | Case Study on Supervised Learning Model Comparison                            |  |
| 47 | Case Study on K-Means Clustering Application                                  |  |
| 48 | Case Study on Hierarchical Clustering   |  |
| 49 | Case Study on DBSCAN for Density-Based Clustering                             |  |
| 50 | Case Study on Gaussian Mixture Models   |  |
| 51 | Case Study on PCA for Dimensionality Reduction                                |  |
| 52 | Case Study on t-SNE for Data Visualization                                    |  |
| 53 | Case Study on Autoencoder-Based Feature Learning                              |  |
| 54 | Case Study on Perceptron-Based Classification                                 |  |
| 55 | Case Study on Multi-Layer Neural Network                                      |  |
| 56 | Case Study on CNN-Based Image Classification                                  |  |
| 57 | Case Study on RNN-Based Sequence Modelling                                    |  |
| 58 | Case Study on LSTM-Based Time Series Prediction                               |  |
| 59 | Case Study on Transfer Learning Application                                   |  |
| 60 | Case Study on Generative Adversarial Networks (GANs)                          |  |
